Pate Parapet Curb

Pate parapet curbs are used to reliably secure a parapet wall to the building's roof deck. They can be custom engineered to meet your exact specifications for any flat or pitched roof.

- Heavy-gauge galvanized steel construction.
- Continuously welded and mitered corners.
- Pressure-treated wood nailers with 1-1/2″ thick fiberglass insulation.

All parapet curbs are internally reinforced in larger sizes and can include exterior liners, and inside and outside corners. Parapet curbs can be specified in straight sided, canted, and raised canted styles to accommodate various roof materials.
